## Python - Working with Text

As we learned before, text, in Python, is case sensitive. Look at the following program :

```
    * Example - H:/My Documents/Classes/TEJ 20/Unit 4 - Python/Exa... _ | X 
File Edit Format Run Options Windows Help
print "Enter your Name",
name = raw_input()
if name == "Josh" or name == "josh" :
    print "Hello Josh"
else :
    print "You aren't Josh"
|
Ln: 7 Col: 0
```

The above, checks the input to see if the user entered all lower case or capitalized the name. To avoid this, we can use some of the following functions. A function is a built-in set of instructions that perform a certain task.

| .upper() | $\rightarrow$ converts the string to all upper case <br> Ex: word = "hello" |
| :---: | :---: |
|  |  |
|  | Print word.upper() |
|  | Output $\rightarrow$ HELLO |
| .lower() | $\rightarrow$ converts the string to all lower case |
|  | Ex : name = "Jones" |
|  | Print name.lower() |
|  | Output $\rightarrow$ jones |

.capitalize() $\rightarrow$ converts the first letter of the string to upper case and the rest to lower case
Ex: sentence = "hello MY name is Bob!"
Print sentence.capitalize()

Output $\rightarrow$ Hello my name is bob!
.title() $\quad \rightarrow$ converts the first letter of every new word to upper case and the remaining letters to lower case

Ex: sentence = "hello MY name is Bob!"
Print sentence.title()
Output $\rightarrow$ Hello My Name Is Bob!
. count() $\rightarrow$ counts the number of times a substring occurs

$$
\begin{array}{ll}
\text { Ex : } & \text { word }=\text { "Hello" } \\
& \text { Print word.count(" } l ") \\
\text { Ox }: \quad \text { Output } \boldsymbol{\rightarrow} \quad \mathbf{2} \quad \text { \{counts how many "l"s there are ) } \\
& \begin{array}{l}
\text { Sentence }=\text { "John told his dad that he had a bad headache" } \\
\text { Print Sentence.count("ad") }
\end{array} \\
\text { Output } \rightarrow \mathbf{4} \quad \begin{array}{l}
\text { \{counts how many times "ad" occurs together ) } \\
\text { John told his dad that he had a bad headache }
\end{array}
\end{array}
$$

$+\quad \rightarrow$ adds string together

$$
\text { Ex: } \quad \text { word1 }=\text { "Hello" }
$$

word2 = "There"
Print word1 + word2

Output $\rightarrow$ HelloThere
*
$\rightarrow$ lets you repeat a string a specified integer number of times
Ex: word = "Hello"
Print word * 3

Output $\rightarrow$ HelloHelloHello

In $\quad \rightarrow$ forces a new line
Ex : word1 = "Hello \n"
word2 = "There"
Print word1, word2

Output $\rightarrow$ Hello
There
$\backslash t \quad \rightarrow$ forces a tab
Ex: $\quad$ word1 $=$ "Hello $\backslash t "$
word2 = "There"
Print word1, word2

Output $\rightarrow$ Hello There

```
len() }\quad->\mathrm{ returns the length of the string
    Ex : word = "hello"
        Print len(word)
    Output }->\mathbf{5
[ ] }->\mathrm{ used to print a certain character in a string (text)
    Ex: word = "Hello"
            Print word[2]
        Output }->\mathbf{I}\quad{\mathrm{ prints the 2 2d character in the string, but starts counting at
                        0... word[0] = "H", word[1]="e", ...-}
[:] }\quad->\mathrm{ used to print a certain character in a string (text)
    Ex: word = "Hello"
            Print word[:2]
    Output }->\textrm{He}\quad{prints the first 2 characters in the string, but starts
        counting at 1}
```

## Assignment \#6

1. Write a program that asks the user to enter a 7 character word. The computer is to check if the length of the string is 7 characters. If it isn't then a message will be displayed "The word is not 7 characters". If it is, then the program will print the word backwards on the screen.

## Enter a 7 Character word: Popcorn

nrocpoP
2. Write a program that asks the user to enter a 7 character word. The computer is to check if the length of the string is 7 characters. If it isn't then a message will be displayed "The word is not 7 characters". If it is, then the program will print the word backwards on the screen.

| Enter a 7 Character word: Popcorn |
| :--- | :--- |
| $\mathbf{P}$ |
| $\mathbf{o}$ |
| $\mathbf{p}$ |
| $\mathbf{c}$ |
| $\mathbf{o}$ |
| $\mathbf{r}$ |
| $\mathbf{n}$ |

3. Write a program that has the user input a sentence and the program returns how many words are in the sentence. ${ }^{* *}$ hint : there are spaces between each word ${ }^{* *}$
4. Write a program that has the user input a sentence and the program returns how many vowels are in the sentence. a, e, i, o, u Make sure it looks at capitals also. (or convert the sentence to all lower case first)
